

spazi

A reverb made of real places.

Spazi is a convolution reverb plugin developed by **Matthew Fortunati**, sound engineer and composer. Rather than simulating rooms, it works from **impulse responses**: recordings of how a real space answers to sound, captured on location with a loudspeaker and a pair of microphones. Any sound passed through Spazi is placed inside that space and takes on its acoustics: the dimensions, the materials, the way a note is allowed to fade.

Ex Train Tunnel: the disused railway tunnel between Narni and Stifone, in the Gole del Nera (Umbria). Every space arrives with its own photographs, taken on location.

1

Each preset is a real place captured on location: no algorithm imitating a room, but the room itself. The library is built one place at a time, starting from a railway tunnel in Umbria.

2

A gallery of photographs travels with every space. Browsing them while playing through the reverb keeps the place, not just its tail, in front of you.

3

Mix, Size, Brightness, Darkness, Decay and Output cover everyday use. The *elsewhere* button opens the plugin's creative side.

places

One place at a time.

Every preset carries the name of the place where it was recorded, together with its photographs. Beyond the railway tunnel near Narni, the library includes theatres and churches: here are two examples, both in Umbria.

TEATRO DEL PAVONE · PERUGIA

An Italian-style horseshoe theatre in the historic centre of Perugia, first built in wood in 1717 and rebuilt in masonry in 1765 to a design by Pietro Carattoli: four tiers of boxes, with the gallery above. The hall was recorded from a central position.

Recording: QSC loudspeaker · a single Line Audio CM3 microphone, mono.

TEMPIO DELLA CONSOLAZIONE · TODI

A Renaissance church on a central Greek-cross plan, built over a century of work, from 1508 to 1607: four apses gathered around a great dome, in a building some fifty metres tall. Recorded by permission of La Consolazione E.T.A.B.

Recording: dodecahedral loudspeaker with subwoofer · Line Audio CM3 microphones as a central ORTF pair and a spaced pair. Photograph: Martelli Manuel Antonio.

elsewhere

The other side of the room.

A single button opens Spazi's creative mode. The panel darkens and the room stops behaving: **Reverse** plays the space backwards; **Distortion** and **Digital** rough up the reverberated signal in two different ways; a **Granular Delay** (Grain Size, Density, Feedback) scatters the tail into grains. And then there is **SPETTRO**, which works a little differently.

elsewhere engaged, MEMORIA at zero: the room as recorded, image sharp.

MEMORIA turned up: the room forgets itself, and the image blurs with it.

SPETTRO: THE ROOM AS A MEMORY

Every other effect in elsewhere works on the reverberated signal. SPETTRO works on the space itself. Behind every impulse response there are thousands of **modes**: resonant frequencies, each ringing and fading at its own rate, which together make the room sound like that room. SPETTRO analyses the recording once, extracts those modes and rebuilds the space from only the most important ones. **MEMORIA** decides how many survive. At zero the room is intact. As the knob rises the space loses resolution, like a memory losing its detail; further on, the surviving modes start to drift out of tune and the room becomes a wrong room; at the far end only a handful remain and the space collapses into a chord: a harmonic drone no real place could produce, still shaped by the place it came from. **RICORDO** rerolls the drift, so every press gives a different false memory of the same room. Decay changes how long the tail lasts; SPETTRO changes what the tail is made of.

DEMONSTRATION VIDEO

A short demonstration of Spazi in use: the quickest way to hear what the plugin does.
